

Surface water drainage plan

House side of the cabin pre staining.

Picture 1

Shows the gutter running from the front to the back of the cabin.

Picture 2

Gutter runs down to the rear of the cabin, to downpipe. Water then runs down towards the front of the cabin. Then down and absorbed into gravel. Just like it did on the stable that was there before it.

Picture 3

This picture shows the gutter and downpipe at the back of the cabin that then connects into the existing drainage plan from the old stable block. The new cabin is a very similar size and so the impact is no different.

Picture 4

This picture shows the existing drainage in the concrete slab

Picture 5

The rain water runs along the concrete run off and absorbed in the gravel drive

Picture 6

This shows the Water butt that will collect 210litres of water to be reused to water the plants in the garden, any excess water will run along the existing drainage seen above.
