Hi Dorothy,

Any permanent fencing that is erected at the property boundaries must have periodic holes (measuring 13cm by 13 cm minimum) at its base to allow the movement of animals, such as hedgehogs, to promote habitat connectivity and extended foraging ranges.

Since this is a retrospective application and this wall is already built, a reasonable alternative would be to create holes in other existing fences along the sides and back of the property.

Biodiversity enhancements are required. Planting a variety of flowering plants in the soil to the front of the new wall would be acceptable if there is space and soil rather than pavement there. Plants should not be evergreen shrubs, which have no wildlife value, but suitable flowering species can be found on the RHS perfect for pollinators list., available at: <https://www.rhs.org.uk/science/conservation-biodiversity/wildlife/plants-for-pollinators>.

Kind regards,
Lisa
