| Tree Number | Species | Condition                                                                                                        | Treework required                                                                                                                            |
|-------------|---------|------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| T2          | Oak     | Heavily asymmetric crown, sporadic dieback                                                                       | Reduce crown by 2-3 m all over to leave a finished branch length of approximately 5 m north, 1 m east, 4 m south and 7 m west for management |
| T4          | Oak     | Significant bark necrosis around buttress roots and base, exposed decaying sapwood, leaning towards houses       | Fell tree for risk management                                                                                                                |
| T5          | Oak     | Leaning towards property, localised decay present on root buttressing western aspect, crown historically reduced | Reduce crown by 2-3 m to previous pruning points for management                                                                              |
