Subject: RE: V/24/97448 - River Itchen WTW Permanent Centrifuge

Hi Liz

Thanks for the additional information. I agree that the scheme does not require an EIA from an ecological perspective.

The PEA must address impacts on habitats and species adjacent to the site, as well as on-site. For example, in addition to residential receptors, ecological receptors are sensitive to noise (it is noted that the centrifuge will be housed in a building and therefore noise impacts will be reduced). Artificial light spill into adjacent and on-site habitats must also be kept to a minimum and consideration must be made for potential shading impacts on these habitats (either existing or created).

Please refer to the most recent EBC validation list for the information required for BNG and ecological assessments.

The Flood Risk Statement should include a surface water drainage strategy which must fully address the four pillars of SuDS. Please refer to EBC policy DM6 for requirements.

Thanks
Sarah
