I have reviewed the site visit photos. The areas affected by the proposal are currently paved. I don't see any potential bat roost features or areas which would provide habitat for other protected species. Surveys are not required. There appear to be some rain gutters on the existing car port which are not connected into the surface water drainage system. A surface water drainage plan will be required to demonstrate that all drainage is accounted for by the current system. This can be conditioned if necessary.

Please could you add the following informative to the decision notice:

In the unlikely event of any bats being found during demolition or construction, all work must stop immediately, and Natural England must be called. Additional information is available on the Bat Conservation Trust website at <https://www.bats.org.uk/advice/im-working-on-a-building-with-bats/ive-found-a-bat-during-works>

This site is in a green impact risk zone for great crested newts. There are records of slow worms, bats, stag beetles and hedgehogs nearby.

To determine whether any surveys are required I need to review close-up photos of any areas of the house, garage and garden which would be affected by the proposal.

Biodiversity enhancements will be required in accord with Local Plan policy DM 11 and NPPF paragraph 180. A bat brick and a swift brick may be appropriate for this building.

The Bat Conservation Trust recommends installing a bat brick/box at least 4 m above the ground, away from artificial light sources, sheltered from strong winds and exposed to the sun for part of the day, facing south, south-east or south-west. (<https://www.bats.org.uk/our-work/putting-up-your-box>)

Swift nest boxes are best positioned under the eaves or on walls facing north, northeast or north-west out of direct sunlight, five metres above the ground, with clear adjacent airspace so swifts can access them in a high-speed direct flight.
