1 INTRODUCTION

1.1 Terms of Reference

Geo-Logic Site Investigations Limited (Geo-Logic) has been appointed on behalf of Eastway Estates Limited to undertake a Phase 1 and Phase Land Contamination Assessment (desk study and site investigation) in connection with the proposed redevelopment at 103 Bournemouth Road, Southampton.

All works were undertaken in accordance with our proposal letter dated 4th July 2023 and referenced t30.

1.2 Background

The site comprises a disused commercial building located at 103 Bournemouth Road, to the west of Eastleigh, Southampton, SO53 3AJ. The site is located at approximate National Grid Reference 443070, 119660 and covers an area of 0.12ha (Figure 1).

Planning permission has been granted for an extension to the existing commercial building, including new refuse and cycle storage (Figure 2).

The aim of these works is to provide information on land contamination risk in support of planning conditions 3 and 4 for the proposed development.

1.3 Scope of Work

The following scope of works has been carried out:

Phase 1 Land Contamination Assessment (Preliminary Risk Assessment): a desk study and site walkover has been undertaken to determine the nature of the site and surrounding area, including former land uses, geology, hydrogeology, hydrology and geoenvironmental data; and

Phase 2 Site Investigation: following the findings of the desk study, an intrusive site investigation was undertaken to assess the ground conditions and potential for contamination at the site that may pose a risk to human health and the environment.

This work has been undertaken in accordance with current guidance such as LCRM - Land contamination: risk management (Environment Agency, 2020), BS10175+A2 (2017) and, where appropriate NHBC/ LABC and Eurocode.

2 DESK STUDY

Information for this preliminary risk assessment (PRA) has been obtained from a site reconnaissance survey and a review of an Envirocheck® report obtained for the site (Appendix B and Appendix C), together with published available information where relevant.

2.1 Site Reconnaissance

A site walkover survey was carried out prior to intrusive works on 3rd August 2023. Observations are presented below and photographs of the site, taken at the time of the walkover survey, are presented in Appendix A.

Table 2.1: Site Details

Feature	Description
Site area, boundaries and access	The site comprises a disused commercial premises located on the corner of Bournemouth Road and Leigh Road, with associated former areas of car parking and vegetation. Hoarding was present around the site at the time of the walkover. Access to the site is from Bournemouth Road to the west. The site is bound to the north by Leigh Road and to the west by Bournemouth Road. Residential properties bound the site to the east and south. The surrounding area is predominantly residential and commercial.
Elevation and topography	The site was noted to be generally level. Ordnance Survey (OS) mapping indicates the site is located at around 40m above ordnance datum (AOD) and that the topography of the surrounding area slopes gently down in a general northeasterly direction.
Land use, site layout and buildings	The existing two-storey commercial building is located in the northwest part of the site, with a temporary portable cabin located in the northeast corner and surrounding area of former car parking and landscaping.
Vegetation	Large areas of overgrown vegetation are present along the eastern and southern site extents, with a small area along the western site edge. A number of mature trees and hedgerows/ vegetation are present along the southern boundary of the site.
Surfacing	The southern area of the site comprises an area of former car parking, laid predominantly to tarmac with some concrete around the edges. The tarmac surfacing was observed to now be in generally poor condition with vegetation growing through the cracks.
Evidence of Potential Contamination	No evidence of significant mobile contaminant sources, including hydrocarbon storage or other chemicals was noted during the site walkover. No evidence of potential asbestos containing material was noted during the site walkover, although a full survey is outside the scope of this report.
General	2no. existing monitoring wells were noted on site within the area of car parking. These were opened and dipped with groundwater levels recorded at 2 – 2.1m below ground level (bgl).

2.2 Site History

A review of the historical Ordnance Survey mapping has been undertaken to identify features both on-site and off-site, which may have geoenvironmental implications for the proposed development. A summary of the findings is presented in Table 2.2.

Table 2.2: Historical Mapping – Key Features

On Site Features	OS Dates
The site comprises part of an open field.	1867 – 1909

A residential property is recorded in the northeast of the site, as per the present day building layout. A further structure is shown along the western edge of the site on 1931 maps only. A small outbuilding is recorded on mapping dating from 1950 onwards.			1931 - 1960
The existing building and car park layout is shown.			1974 - 2023
Surrounding Features	Distance	Direction	OS Dates
Pumping stations (South Hants Water Works Co)	~80m	West	1909 – 1950
Brick works (disused by 1963 mapping)	From ~750m	Northwest	1897 – 1938
Velmore camp with tanks (redeveloped for residential housing by 1960)	From ~100m	Southeast	1950 – 1952
Nursery (North End Nursery)	~260m	East	1950 - 1972
Garage (Repositioned and expanded on 1992 mapping)	~90m ~60m	North	1960 - 2023
Warehouse, depots and works (later Chandler's Ford Industrial Estate with electrical substation and tanks)	From ~250m	Northwest	1973 - 2023

2.3 Geology

The published geological mapping indicates the site to be underlain by superficial River Terrace Deposits, underlain in turn by the solid geology of the Wittering Formation. Descriptions of the strata, as provided by the British Geological Survey, is provided in the table below.

Table 2.3: Geology

BGS Geological Mapping (Ref. Solid and Drift 1:50,000 map – Southampton 315, 1987)			
Geological Unit	Age	Thickness	BGS Description
Made Ground	Unknown	Unknown	Not recorded on geological mapping but shallow/ localised deposits may be present on site.
Superficial Deposits: River Terrace Deposits (5 th terrace)	Quaternary	Unknown	"River Terrace Deposits consist of alluvium forming one of a series of level surfaces in a stream or river valley, produced as the dissected remnants of earlier abandoned floodplains. Sand and gravel, locally with lenses of silt, clay or peat."
Solid Geology: Wittering Formation	Early Eocene	40-53m	"Greyish brown laminated clay; wavy- to lenticular-bedded sand interbedded with clay in equal proportions; and fine- to medium-grained sparsely glauconitic sand."

No faults are recorded in the immediate vicinity of the site on the available geological mapping.

The nearest BGS borehole records are outlined below:

- **SU41NW726** (~250m northwest of the site): Ground materials recorded as reddish brown-stained pale grey stiff clay to 0.2m, underlain by loose orange-brown medium grained sand to 0.6m, underlain in turn by laminated clay with partings and some thin bands of sand and lignite.

2.4 Natural Soil Chemistry

Normal background concentrations for a selection of contaminants of potential concern present within the natural soils, as published by the BGS, are presented in Table 2.4.

Table 2.4: Background Natural Soil Chemistry

Element	BGS Normal Background Concentration	GAC (Commercial)
Arsenic	9.08 – 10.7 mg/kg	640 ⁽¹⁾
Cadmium	<0.33 mg/kg	190 ⁽¹⁾
Copper	15.4 – 21.6 mg/kg	68000 ⁽¹⁾
Lead	47.1 – 99.5 mg/kg	2300 ⁽²⁾
Nickel	13.2 – 16.7 mg/kg	980 ⁽¹⁾

1 LQM/CIEH S4ULs (2015)

2 DEFRA C4SLs (2004)

2.5 Radon

The property is identified within the Envirocheck[®] report to be in a lower probability radon area (less than 1% of homes are estimated to be at or above the Action Level). No radon protective measures are necessary in the construction of new dwellings or extensions.

2.6 Mineral Extraction and Ground Stability

There are no recorded historical mineral sites located within 250m of the site.

Further potential ground stability features noted from the Envirocheck[®] report for the site are summarised in the table below.

Table 2.5: Ground Stability

	No Hazard	Negligible	Very Low	Low	Moderate	High
Collapsible ground			x			
Compressible ground	x					
Ground dissolution	x					
Landslide			x			
Running sand				x		
Shrink/swell clays					x	
Coal mining	x					
Non coal mining	x					

2.7 Hydrogeology

The Envirocheck[®] report and Environment Agency information records the following hydrogeological setting for the site.

Table 2.6: Aquifer Characteristics

Geological Unit	Aquifer Designation/ Groundwater Vulnerability	Environment Agency Aquifer Classification	Potential Hydraulic Gradient Direction
River Terrace Deposits	Secondary A Aquifer – Medium Vulnerability	Permeable layers capable of supporting water supplies at a local rather than strategic scale, and in some cases forming an important source of base flow to rivers.	Likely northeast, following local topography
Wittering Formation			Unknown

The site is not located within 1km of an Environment Agency designated Source Protection Zone.

There are no licensed groundwater abstraction located within 1km of the site.

The site is located in an area reported by the BGS to have limited potential for groundwater flooding to occur.

2.8 Hydrology

The nearest surface water feature is an unnamed stream or ditch recorded 268m north of the site. The nearest significant water course is the Monks Brook, located approximately 750m east of the site at its closest point.

There are no surface water abstractions recorded within 1km of the site.

The site is not reported as being located within an area of potential flooding from either rivers or the sea, according to the Envirocheck report. Further consideration of the risk or consequences of flooding is not, however, within the scope of this report.

2.9 Environmental Setting

The site is located within the Hamble Estuary eutrophic nitrate vulnerable zone (NVZ). No further sensitive land uses are identified within 250m of the site.

Other environmental data provided within the Envirocheck report is summarised in the following table.

Table 2.7: Environmental Data

Item	Number within 250m	Details of Nearest Feature
Discharge Consents	0	-
Local Authority Pollution Prevention and Control Entries	1	100m north, Rowles Picador Ltd, PG1/14 petrol filling station.
Pollution Incidents	1	132m south, Rowles garage, petroleum leaking on garage forecourt, category 3 minor incident, August 1998.
Prosecutions relating to authorised processes entries	0	-
Substantiated pollution incident register entries	0	-
Historical or current landfills	0	-
Registered Waste Transfer/ Treatment or Disposal Sites	0	-

There are 11 contemporary trade directory entries reported within a 250 m radius of the site, most notably including a dry cleaners (previously on site); car dealers (71m and 101m north); petrol filling station (100m north); and printing equipment manufacturers (168m northwest).

The nearest recorded fuel station entry is identified 100m north (former Esso/ Rowles Garage), reported to be obsolete. This was noted during the walkover survey to have been redeveloped as part of the Vauxhall car sales and servicing centre.

3 PRELIMINARY RISK ASSESSMENT

3.1 Potential Sources of Contaminants

Based on the desk study research and site walkover survey, potential on-site sources of contaminants have been identified associated with the site and surrounding area, and with regard to the proposed development, as summarised in Table 3.1 and Table 3.2 below.

Table 3.1: Potential On-Site Contaminant Sources

Potential Source	Rationale/ Additional Information
Made ground	Made ground of unknown chemical composition may be present given the previous development of the site and commercial use, including car park area.
Former dry cleaners	Historical mapping indicates the site may have been a residential property until around the 1970s when the current layout with car park is shown. It is not known how long the property was occupied by the dry cleaners. VOCs are the main potential contaminants of concern associated with the former dry cleaners. The Department of the Environmental Industry Profile for dry cleaning (included under Miscellaneous Industries, 2016) notes that perchloroethylene (PCE) has been the dominant dry cleaning solvent used in the UK from the 1950s to the present day.

Table 3.2: Potential Off-Site Contaminant Sources

Potential Source	Rationale/ Additional Information
Former petrol filling station and car garage, 100m north	The former petrol filling station has been recently redeveloped and is now part of the Vauxhall car sales and servicing centre. These features are located topographically downgradient of the site and therefore on-site migration of contamination is considered unlikely.
Former military camp (Velmore camp), from 100m southeast	A former military camp is recorded on early 1950s historical mapping and assumed to have been established during WWII. A number of tanks are shown on the mapping within the camp area. The site was later redeveloped for housing in the 1960s. Potential on-site contaminant migration from historical activities at the former military camp cannot be discounted at this stage.

3.2 Potential Receptors

Potential receptors identified by this assessment are summarised in Table 3.3 below.

Table 3.3: Potential Receptors

Potential Receptor	Description
Human Health	Current and future site end users/ neighbours
Controlled waters/ aquatic environment	Secondary A Aquifers (River Terrace Deposits and Wittering Formation); and surface waters (unnamed stream/ ditch) and Monks Brook
Proposed structures	Extension proposed to the existing commercial premises
Ecology	Proposed planting

It should be noted that health and safety risks to site contractors and maintenance workers have not been assessed during these works and will need to be considered separately within appropriate construction risk assessments/ method statements.

3.3 Hazard Assessment and Risk Estimation

Potential contaminant linkages identified as part of this preliminary risk assessment are summarised in the initial conceptual site model presented in the table below. References to risk estimations are made in accordance with the methodology presented in CIRIA publication C552 (2001) titled 'Contaminated Land Risk Assessment: A Guide to Good Practice', as summarised in Appendix G.

Table 3.4: Initial Conceptual Site Model

Source	Associated Contaminants	Receptor	Pathway	Consequence	Discussion of Potential Pollutant Linkages	Likelihood	Risk
On site - made ground	Metals, semi-metals, PAH, phenols, asbestos	Human health – site end users	Ingestion, inhalation and dermal contact	Medium	Historical mapping indicates the site was residential prior to its commercial use around the 1970s. Areas of tarmac and concrete were noted in the car park during the site walkover. The site is underlain by Secondary A Aquifers and is not within a groundwater Source Protection Zone. Anticipated contaminants within any made ground associated with the previous development are unlikely to be significantly mobile in an aqueous environment.	Low likelihood	Moderate/Low
		Ecology	Plant uptake	Mild		Low likelihood	Low
		Controlled waters	Leaching into underlying groundwater Migration in solution via groundwater	Mild		Low likelihood	Low
	Ground gases - CO ₂ , CH ₄ , CO, H ₂ S	Human health – site end users/ proposed structures	Migration, ingress and accumulation (and inhalation) of ground gasses.	Severe	The potential for significant made ground to be present that may be a source of ground gas generation is considered unlikely given the limited development history of the site.	Unlikely	Moderate/Low
On site – former dry cleaners	VOCs (PCE, TCE, DCE and VC)	Human health – site end users	Ingestion, inhalation and dermal contact	Medium	Leaks and spills from former operational use of the dry cleaners may have contaminated shallow soils/ groundwater at the site.	Low likelihood	Moderate/Low
		Controlled waters	Leaching into underlying groundwater Migration in solution via groundwater	Mild		Low likelihood	Moderate/Low
Off-site - potentially contaminative land uses including garage, petrol filling station and military camp	TPH, VOCs, SVOCs and ground gases - CO ₂ , CH ₄ , CO, H ₂ S	Human health – site end users	Migration, ingress and accumulation of ground gases/ VOCs within buildings (and inhalation by future occupants)	Medium to severe	Surrounding contaminative land uses have been identified including a garage and former petrol filling station (although the garage and PFS are anticipated to be downgradient of the site); and a historical military camp to the southeast. There is potential for contaminants to migrate onto site via shallow groundwater, and ground gas/ vapour migration through shallow granular deposits (River Terrace Deposits/ Wittering Formation).	Low likelihood	Moderate/Low

4 GROUND INVESTIGATION

4.1 Background and Rationale

The ground investigation was designed to assess the potential pollutant linkages outlined within the preliminary risk assessment.

The investigation works were undertaken under the supervision of a suitably experienced, chartered engineering geologist from Geo-Logic Site Investigations Limited. All site works were undertaken in general accordance with BS5930:2015+A1:2020 and BS10175+A2:2017.

4.2 Ground Investigation Methodology

A summary of the ground investigation works undertaken and the rationale for each location is provided in in Table 4.1, as follows:

Table 4.1: Summary of Ground Investigation Works

Investigation Method	Location	Date(s)	Location Rationale/ Purpose
Window sample boreholes	WS01 – WS04	03/08/2023	Positioned to provide spatial coverage across the site. To allow for characterisation of shallow ground conditions and collection of samples for geoenvironmental laboratory analysis.

Exploratory hole locations are presented on Figure 3 and detailed descriptions of encountered ground conditions are shown on exploratory hole logs presented in Appendix D. All boreholes refused at depths between 1.6m and 3.1m on very dense gravel.

4.3 Field Testing

A summary of in situ field testing undertaken as part of these ground investigation works is provided in Table 4.2.

Table 4.2: Summary of Field Testing

Field Test	Purpose
Photo-ionisation detector (PID)	Indication of the presence of volatile organic compounds (VOCs)

4.4 Geoenvironmental Testing

Laboratory testing was scheduled on the basis of the desk study and field observations. All samples were collected, stored and transported in accordance with BS10175:2011, for testing at Chemtech Environmental Ltd (a UKAS/MCERTS accredited laboratory).

Soil samples were collected and tested for a selection of the following suite of determinands;

- Heavy metals/ semi-metals;
- Total organic carbon/ soil organic matter;
- Total phenols
- Total cyanide
- Sulphates and pH;
- Speciated polycyclic aromatic hydrocarbons (PAH);
- Total petroleum hydrocarbons (TPH);
- Volatile organic compounds and semi-volatile organic compounds; and
- Asbestos screen

Geochemical laboratory certificates of analysis are presented in Appendix F.

4.5 Ground Conditions

The exploratory holes have established that, within the depth of investigation, the site is underlain by the following general sequence of strata (from ground level down).

Table 4.3: Encountered Ground Conditions

Strata	Locations Encountered	Depth to Top (m)	Depth to Bottom (m)	Thickness (m)
Made Ground	WS01, WS02 and WS04	0	0.5-0.9	0.5-0.9
Topsoil	WS03	0	0.1	0.1
River Terrace Deposits	WS01 – WS04	0.5 – 0.9	>3.1	>2.5

Made Ground/ Topsoil

A shallow thickness of made ground was encountered across the site, typically encountered as tarmac underlain by brown sandy gravel or gravelly sandy clay, with gravel of flint. Occasional fragments of fine charcoal were noted in WS02 only.

No made ground was recorded in WS03 - located in an area of soft landscaping in the southeast of the site – with near surface soils recorded as dark brown silty gravelly sand (gravel of flint) with frequent rootlets.

River Terrace Deposits

River Terrace Deposits were encountered beneath the made ground in each exploratory hole location. These were generally encountered as soft to firm sandy gravelly clay, underlain by medium dense silty/ clayey sand or firm sandy clay, underlain in turn by very dense clayey sandy gravel. The gravel component was generally recorded as fine to coarse rounded to angular flint.

Groundwater

A shallow groundwater body was recorded at the site, within the superficial River Terrace Deposits. Groundwater observations recorded during the ground investigation works are summarised in Table 4.4 below.

Table 4.4: Summary of Groundwater Observations

Location	Groundwater Observations	Strata
WS01	Groundwater strike at 2.3m, rising to 2.0m after 20mins	River Terrace Deposits
WS02	Groundwater strike at 2.9m	
WS03	No groundwater encountered (borehole refused at shallow depth of 1.6m)	
WS04	Groundwater strike at 2.8m	

4.6 Contamination Observations

No visual or olfactory evidence of contamination was observed during the ground investigation. All soil samples were screened on site with a photo-ionisation detector (PID) for indication of the presence of volatile organic compounds, with concentrations all recorded to be below the limit of detect of the instrument (i.e. 0ppm).

5 GENERIC QUANTITATIVE RISK ASSESSMENT

5.1 Background

Generic risk assessments have been undertaken in accordance with the Environment Agency land contamination management (LCRM) guidance (2023).

5.2 Human Health Risk Assessment

Methodology

The soil chemical test results have been compared to generic assessment criteria (GAC) that are considered appropriate for the proposed site end use, in order to provide an initial assessment of the potential risk to human health.

Generic Assessment Criteria (GAC) used within this assessment have been adopted from the following publications;

- Category 4 Screening Levels (C4SLs) issued by Defra in 2013;
- Soil Guideline Values (SGVs) issued by the Environment Agency in 2009;
- Suitable 4 Use Levels (S4ULs) issued by the Chartered Institute of Environmental Health (CIEH)/Land Quality Management in 2014; and
- Dutch Intervention Value (DIV) for total cyanide in the absence of a UK published value or guidance.

The GAC used within this assessment have been conservatively selected based on a commercial site end use and a 1% soil organic matter (SOM).

No visual or olfactory evidence of contamination was encountered during the intrusive site works. Therefore, 3no. soil samples were collected from the shallow made ground that end users may come into contact with via the dermal contact, ingestion and inhalation pathways, to assess the potential chronic human health risks; and 3no. soil samples were collected from the groundwater interface to assess for evidence of organic contaminants (TPH, VOCs, and SVOCs) associated with the former use of the site as a dry cleaners; and potential on-site migration from surrounding land uses.

As the site investigation methodology involved targeted sampling, and based on the number of samples collected, statistical analysis has not been undertaken and the results have been directly compared to the GAC.

Summary of Results

Laboratory test certificates for the soil chemical analysis are presented in Appendix E. The full human health generic quantitative risk assessment is presented in Appendix F.

Concentrations of determinands were all recorded to be below the relevant GAC for the proposed continued commercial site end use.

In addition, concentrations of TPH, volatile and semi-volatile organic compounds (VOCs and SVOCs) were all recorded to be below the laboratory limit of detect in the tested soil samples.

No asbestos fibres were detected in any of the soil samples tested.

5.3 Phytotoxicity

Substances with phytotoxic potential can have an effect on the establishment and healthy growth of planting introduced to areas of landscaping. Potentially phytotoxic substances can include metals such as copper, nickel and zinc. All concentrations of these metals within the tested shallow soils are noted to be below the threshold values outlined within the British Standard publications BS3882:2015 (Specification for topsoil) and BS8601:2013

(Specification for subsoil and requirements for use). Other soil contaminants and ground conditions should be considered for any proposed planting within the development and reference should be made to relevant guidance documents.

5.4 Controlled Waters Risk Assessment

A shallow groundwater body was recorded within the River Terrace Deposits, with groundwater strikes recorded at depths between 2.3m and 2.9m.

No visual or olfactory evidence of contamination was noted within the soil or groundwater encountered at the site during the intrusive works. Screening of soil samples with a PID on site did not indicate the presence of VOCs, with all concentrations recorded at 0.0ppm.

In addition, concentrations of TPH, VOCs and SVOCs were recorded to be below the laboratory limit of detection within the shallow soils collected in proximity to the dry cleaning premises, and within soil samples collected from the depth of the groundwater interface.

Therefore, no evidence of contamination from the former dry cleaners, or on-site migration of contamination from the historical off-site military camp or garage/ former petrol station has been recorded.

The site is not located within a Source Protection Zone (SPZ) and there are no recorded groundwater or surface water abstractions within 1km of the site.

The risk to controlled waters is therefore low based on the desk study and ground investigation works and no further assessment is considered to be required.

5.5 Ground Gas Risk Assessment

In accordance with BS8485:2019 and CL:AIRE RB17, a qualitative assessment of the risk posed by ground gases at the site has been undertaken based on the desk study report, the site investigation works and the conceptual site model. The following site-specific information has been considered as part of the assessment:

- There are no landfill or waste sites recorded within 250m of the site;
- Ground conditions were recorded to comprise a shallow thickness of made ground only, typically of inert type material of clay, sand and flint gravel (rare fine fragments of charcoal were recorded in a single location only), underlain by natural River Terrace Deposits of typically sand and gravel with varying clay proportions;
- No evidence of contamination was noted during the site investigation; and
- The property is not in a radon Affected Area, with less than 1% of properties above the Action Level and therefore radon protection measures are not required.

Based on the above, no further ground gas monitoring or assessment and no specific ground gas remedial measures are considered to be required in relation to the proposed development at this stage.

5.6 Updated Conceptual Site Model

The findings of the site investigation and the GQRA present above have been used to update the conceptual site model (previously presented within the EEGSL desk study report), to identify relevant pollutant linkages associated with the proposed development.

Updated Contaminant Sources

A review of the previously identified potential sources of contaminants following the findings of the site investigation is provided in Table 5.1 below.

Table 5.1: On-Site Contaminant Sources

Source	Review
Made ground	A shallow thickness of made ground was encountered across the site in areas of existing hardstanding. No contaminants of potential concern in relation to the proposed site end use were recorded within the tested made ground.
Former dry cleaners	No evidence of contamination associated with the previous use of the site as a dry cleaners was recorded during the site investigation and therefore this potential source of contamination has not been considered further within this assessment.

Table 5.2: Off-Site Contaminant Sources

Sources	Review
Former petrol filling station and car garage, 100m north	No evidence of on-site migration of contamination was noted during the site investigation works. Soil samples collected from the depth of the groundwater interface recorded concentrations of TPH, VOCs and SVOCs to all be below the laboratory limit of detect and screening on site with a PID recorded VOC concentrations within the underlying soils to be 0.0ppm. Therefore, these potential sources of contamination have not been considered further within this assessment.
Former military camp (Velmore camp), from 100m southeast	

5.7 Receptors

Based on the desk study, findings of the site investigation and the proposed development, the receptors summarised in Table 5.3 are still considered relevant for this assessment.

Table 5.3: Receptors

Receptors	Description
Human Health	Current and future site end users/ neighbours
Controlled waters/ aquatic environment	Secondary A Aquifers (River Terrace Deposits and Wittering Formation); and surface waters (unnamed stream/ ditch) and Monks Brook
Proposed structures	Extension proposed to the existing commercial premises

Pollutant Linkages

The updated conceptual model for the identified pollutant linkages is shown below in Table 5.4.

Table 5.4: Updated Conceptual Site Model

Source	Associated Contaminants	Receptor	Pathway	Consequence	Discussion of Potential Pollutant Linkages	Likelihood	Risk
Made Ground	No specific contaminants of potential concern identified	Human health – current and future site end users and neighbours	Ingestion, inhalation and dermal contact	Medium	A shallow thickness of made ground was encountered across the site in areas of existing hardstanding. No contaminants of potential concern in relation to the proposed site end use were recorded within the tested made ground.	Unlikely	Low
		Controlled waters/aquatic environment	Leaching into underlying groundwater	Medium	Given the limited thickness of made ground, the total concentrations of contaminants recorded, and as much of the development will be laid to hardstanding, no risk to controlled waters from leaching of contaminants within the made ground to the underlying groundwater has been identified.	Unlikely	Low
		Proposed structures	Ingress and accumulation of ground gases	Severe	Given the limited thickness of made ground, together with the inert nature of the deposits encountered (typically clay, sand and flint gravel), the made ground on site is considered unlikely to be a source of significant ground gas generation that may pose a risk to the proposed development.	Unlikely	Low

6 REMEDIATION AND RISK MANAGEMENT RECOMMENDATIONS

6.1 Background

The assessment has identified no plausible pollutant linkages at the site that would require mitigation for the proposed site end use.

Therefore, no remedial measures are considered to be required for the proposed development.

6.2 Unforeseen Risks During Development

It is anticipated that similar ground conditions are present across the site to those encountered during these works. However, should evidence of former mine workings, significant thickness of made ground, or evidence of contamination be identified during the development works, further investigation and assessment will be required by a suitably qualified person.

6.3 Construction Health and Safety

It is recommended that construction workers at the site adopt appropriate personal hygiene precautions at the site and use personal protective equipment as required, particularly provision of washing facilities, wearing of gloves and avoidance of hand to mouth contact (e.g. eating or smoking), especially when dealing with made ground.

6.4 Water Supply Pipes

The water company should be contacted prior to installation of water supply pipes. Targeted testing and site specific assessment may be required along proposed pipeline routes.

6.5 Waste

Waste testing and characterisation has not been undertaken as part of these works. Testing may be required to support off-site disposal of soils from site.

7 SUMMARY

The site comprises a disused commercial building located at 103 Bournemouth Road, to the west of Eastleigh, Southampton, SO53 3AJ. Planning permission has been granted for an extension to the existing commercial building, including new refuse and cycle storage.

A Phase 1 (desk study) and Phase 2 (site investigation) have been undertaken, comprising 4no. window sample boreholes across the site to assess ground conditions and obtain samples for geoenvironmental laboratory analysis.

The investigation recorded a shallow thickness of made ground within existing areas of hardstanding (to depths between 0.5m and 0.9m), underlain by natural ground comprising River Terrace Deposits. A shallow groundwater body was encountered at depths between 2.3m and 2.9m.

No evidence of contamination was identified during the site investigation works.

Laboratory analysis of the made ground has recorded no elevated concentrations of contaminants in relation to generic assessment criteria (GAC) for a commercial site end use.

In addition, laboratory analysis of the made ground and soil samples collected at the depth of the groundwater interface recorded concentrations of TPH, VOCs and SVOCs to be below the laboratory limit of detect. Screening of soil samples on site with a PID also recorded VOC concentrations within the underlying soils to be 0.0ppm. Therefore, no evidence of contamination associated with the previous use of the site as a dry cleaners, or from on-site migration from surrounding current and previous land uses, has been identified.

On the basis of the desk study and site investigation, no plausible pollutant linkages have been identified associated with the site and no remedial measures are considered to be required for the proposed development.

Published 1867

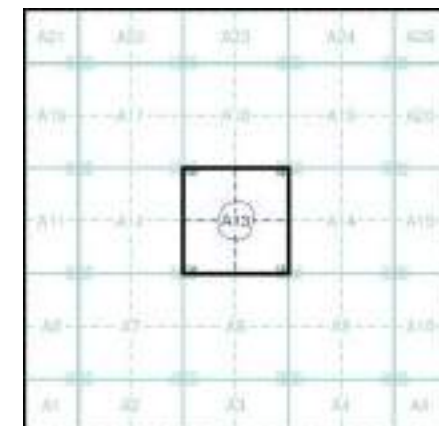

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Large-Scale National Grid Data

Published 1992

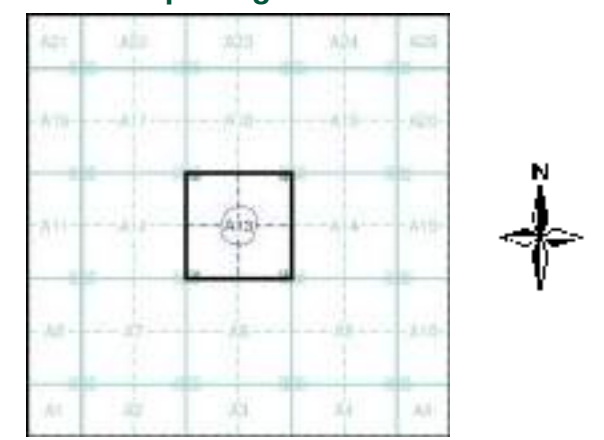

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Published 1872
Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Published 1931

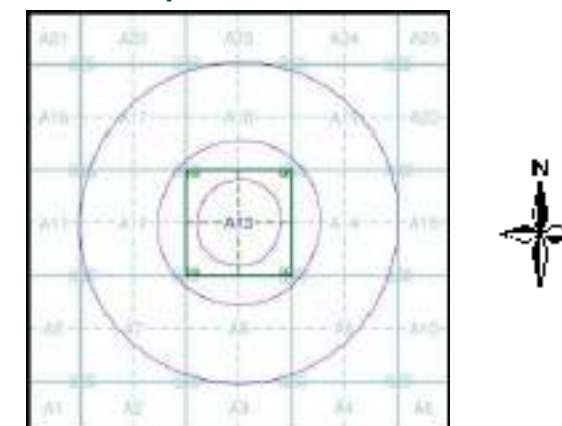

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

10k Raster Mapping

Published 2000

Source map scale - 1:10,000

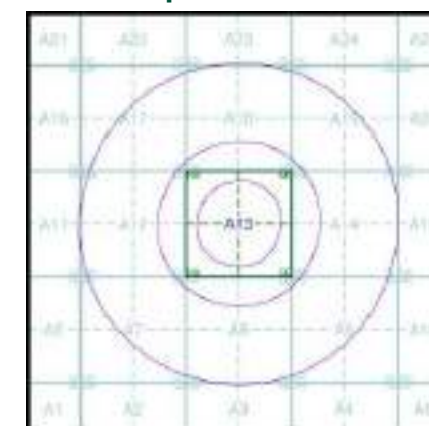

The historical maps shown were produced from the Ordnance Survey's 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Index Map

For ease of identification, your site and buffer have been split into Slices, Segments and Quadrants. These are illustrated on the Index Map opposite and explained further below.

Slice
Each slice represents a 1:10,000 plot area (2.7km x 2.7km) for your site and buffer. A large site and buffer may be made up of several slices (represented by a red outline), that are referenced by letters of the alphabet, starting from the bottom left corner of the slice "grid". This grid does not relate to National Grid lines but is designed to give best fit over the site and buffer.

Segment
A segment represents a 1:2,500 plot area. Segments that have plot files associated with them are shown in dark green, others in light blue. These are numbered from the bottom left hand corner within each slice.

Quadrant
A quadrant is a quarter of a segment. These are labelled as NW, NE, SW, SE and are referenced in the datasheet to allow features to be quickly located on plots. Therefore a feature that has a quadrant reference of A7NW will be in Slice A, Segment 7 and the NW Quadrant.

SAMPLE INFORMATION

MCERTS (Soils):

Soil descriptions are only intended to provide a log of sample matrices with respect to MCERTS validation. They are not intended as full geological descriptions. MCERTS accreditation applies for sand, clay and loam/topsoil, or combinations of these whether these are derived from naturally occurring soils or from made ground, as long as these materials constitute the major part of the sample. Other materials such as concrete, gravel and brick are not accredited if they comprise the major part of the sample.

DEVIATING SAMPLE INFORMATION

Comments

Sample deviation is determined in accordance with the UKAS note "Guidance on Deviating Samples" and based on reference standards and laboratory trials.

For samples identified as deviating, test result(s) may be compromised and may not be representative of the sample at the time of sampling.

Chemtech Environmental Ltd cannot be held responsible for the integrity of sample(s) received if Chemtech Environmental Ltd did not undertake the sampling. Such samples may be deviating.

Key

N	No (not deviating sample)
Y	Yes (deviating sample)
NSD	Sampling date not provided
NST	Sampling time not provided (waters only)
EHT	Sample exceeded holding time(s)
IC	Sample not received in appropriate containers
HP	Headspace present in sample container
NCF	Sample not chemically fixed (where appropriate)
OR	Other (specify)

Lab ref	Sample id	Depth (m)	Deviating	Tests (Reason for deviation)
125537-1	WS01	0.50-0.60	N	
125537-2	WS01	2.30-2.40	N	
125537-3	WS02	0.50-0.60	N	
125537-4	WS02	3.00-3.10	N	
125537-5	WS03	0.0-0.40	N	
125537-6	WS04	0.60-0.70	N	

Chemtech Environmental Limited

ADDITIONAL INFORMATION

Notes

Opinions and interpretations expressed herein are outside the UKAS accreditation scope.

Unless otherwise stated, Chemtech Environmental Ltd was not responsible for sampling.

All testing carried out at Unit 6 Parkhead, Stanley, DH9 7YB, except for subcontracted testing.

Methods, procedures and performance data are available on request.

Results reported herein relate only to the material supplied to the laboratory.

This report shall not be reproduced except in full, without prior written approval.

Samples will be disposed of 4 weeks from initial receipt unless otherwise instructed.

BTEX compounds are identified by retention time only and may include interference from co-eluting compounds.

For soils and solids, all results are reported on a dry basis. Samples dried at no more than 30°C in a drying cabinet.

For soils and solids, analytical results are inclusive of stones, where applicable.

Moisture Content Calculated on a Wet Weight basis

APPENDIX F

Human Health Generic Quantitative Risk Assessment

Table 1 - Estimation of Chronic Human Health Risks for Standard Commercial Land Use (1 % SOM)								
Contaminant	Units	GAC	WS01	WS01	WS02	WS02	WS03	WS04

Notes

GAC	Generic Assessment Criteria. All GAC are S4ULs published by CIEH/LQM in 2014, unless otherwise stated.
CASL	Category 4 Screening Level published by DEFRA in 2013.
DIV	Dutch Intervention Value (VROM 2000)
NAD	No asbestos detected
LOD	Limit of detection
Value	Shaded cells indicate samples in which GAC is exceeded.

APPENDIX G

Risk Evaluation

The contaminated land risk assessment methodology within this report is based on CIRIA C552 (2001) Contaminated Land Risk Assessment – A Guide to Good Practice, in order to quantify potential risk via risk estimation and risk evaluation, which can be adopted at the Phase I stage. The methodology requires the classification of:

- the magnitude of the consequence (severity) of a risk occurring, and
- the magnitude of the probability (likelihood) of a risk occurring.

The potential consequences of contamination risks occurring at this site are classified in accordance with the tables below, as extracted from CIRIA C552.

Table 1: Classification of Consequence

Classification	Definition of Consequence
Severe	Short-term (acute) risks to human health likely to result in “significant harm” as defined by the Environmental Protection Act 1990, Part IIA. Short-term risk of pollution of sensitive water resource. Catastrophic damage to buildings/property. A short-term risk to a particular ecosystem, or organism forming part of such an ecosystem.
Medium	Chronic damage to Human Health (significant harm as defined in DEFRA, 2012). Pollution of sensitive water resources. A significant change in a particular ecosystem, or organism forming part of such an ecosystem.
Mild	Pollution of non-sensitive water resources. Significant damage to crops, buildings, structures and services (“significant harm” as defined in the DEFRA, 2012). Damage to sensitive buildings/structures/services or the environment.
Minor	Harm, though not necessarily significant harm, which may result in a financial loss, or expenditure to resolve. Non-permanent health effects to human health (easily prevented by means such as personal protective clothing etc.). Easily repairable effects of damage to buildings, structures and services.

Table 2: Classification of Probability

Classification	Definition of Probability
High likelihood	There is a pollutant linkage and an event that appears very likely in the short term and almost inevitable over the long term or there is evidence at the receptor of harm or pollution.
Likely	There is a pollution linkage and all the elements are present and in the right place, which means that it is probable that an event will occur. Circumstances are such that an event is not inevitable, but possible in the short term and likely over the long term
Low likelihood	There is a pollutant linkage and circumstances are possible under which an event could occur. However, it is by no means certain that even over a longer period such an event would take place, and is less likely in the shorter term.
Unlikely	There is a pollutant linkage but circumstances are such that it is improbable that an event would occur even in the very long term.

For each possible contaminant linkage (source-pathway-receptor) identified, the potential risk is evaluated based upon the following probability and consequence matrix shown overleaf in Table 3.

Table 3: Contamination Risk Matrix

		Consequence			
		Severe	Medium	Mild	Minor
Probability	High likelihood	Very high risk	High risk	Moderate risk	Moderate/ low risk
	Likely	High risk	Moderate risk	Moderate/ low risk	low Risk
	Low likelihood	Moderate risk	Moderate/ low risk	Low risk	Very low risk
	Unlikely	Moderate/ low risk	Low risk	Very low risk	Very low risk

Based upon this, CIRIA C552 present definitions of the risk categories, together with the investigatory and remedial actions that are likely to be necessary in each case, as in Table V-4. These risk categories apply to each contaminant linkage.

Table 4: Definition of Risk Categories/ Action Required

Classification	Definition and Likely Action Required
Very high	There is a high probability that severe harm could arise to a designated receptor from an identified hazard, OR, there is evidence that severe harm to a designated receptor is currently happening. This risk, if realised, is likely to result in a substantial liability. Urgent investigation (if not undertaken already) and remediation are likely to be required
High	Harm is likely to arise to a designated receptor from an identified hazard. Realisation of the risk is likely to present a substantial liability. Urgent investigation (if not undertaken already) is required and remedial works may be necessary in the short term and are likely over the longer term.
Moderate	It is possible that harm could arise to a designated receptor from an identified hazard. However, if [it] is relatively unlikely that any such harm would be severe, or if any harm were to occur it is more likely that the harm would be relatively mild. Investigation (if not already undertaken) is normally required to clarify the risk and to determine the potential liability. Some remedial works may be required in the longer term.
Low	It is possible that harm could arise to a designated receptor from an identified hazard, but it is likely that this harm, if realised would at worst be relatively mild.
Very Low	There is a low possibility that harm could rise to a receptor. In the event of such harm being realised it is not likely to be severe.
