

Proposed Works

Tree Oak G53 (547) to front of house

This tree leans to the north, and is fairly one sided over Gordon Road. The lower branches hang too low over the road.

Proposed Works

Crown lift over highway to 6m, removing the lower boughs as outlined in red.

Tree Oak G53 (546) to front of house

Proposed Works

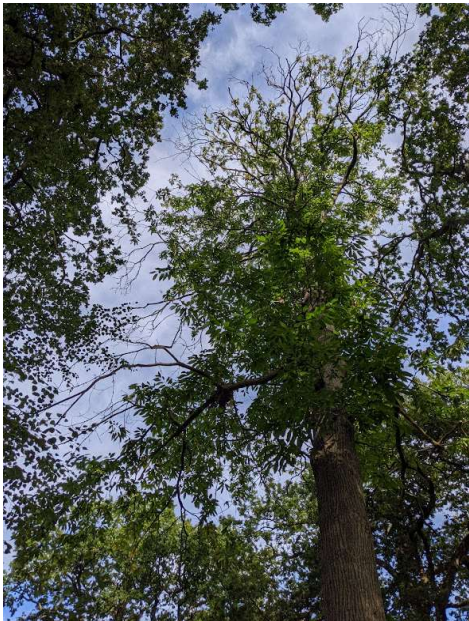

Crown lift up to 6m (mostly epicormic growth which is encroaching into drive), remove deadwood from over highway and driveway to protect pedestrians and cars.

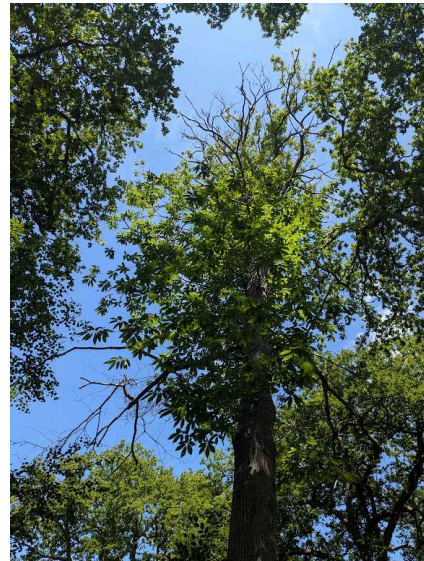

Tree Sweet Chestnut T92 (551). Rear garden.

This tree has been progressively dying over recent years and has lost significant boughs. Tree has many dead boughs high up in the crown, which could cause severe injury or death if they fall on someone from a height of 20m.

Work required

Remove tree. Advice from two tree specialists was that the tree would not survive the stress of being pollarded or cut shorter due to its age and the fact that it had already lost significant growth. There is a risk that due to its height and declining health it could fall on the house.

Oak 246 A-E at rear of garden

This tree lost its last significant bough into a neighbours garden in the spring when it was coming into bud. There is no real growth left on the tree.

Proposed Works - remove the tree.

In the garden as a whole there are two new silver birch and a beech which we have grown over the past 15 years in proximity to the two trees which are proposed for removal, along with a couple of acers. We have tried to increase the diversity in the garden.
